Profile

I am a 2024 BCA graduate building a career in DevOps and Cloud Computing. I prefer practical implementation over just theory — I've built a serverless portfolio site on AWS with infrastructure managed through Terraform, and a load-balanced networking project using Nginx and EC2.I am looking for a Junior DevOps or Cloud Associate role where I can apply my skills and grow

Education and Training

Punyashlok Ahilyadevi Holkar Solapur University Solapur, Maharashtra
Bachelor of Computer Applications in Computer Science *Aug 2021 – Jun 2024*

- Academic project: Employee Management System in Django with CRUD operations and department and role filtering

Scaler Academy Sep 2024 – Present
Specializing in DevOps and Cloud Computing

- Coursework covers Linux, Docker, Kubernetes, CI/CD, AWS, Terraform and monitoring
- Current project: containerized application deployed on Kubernetes with GitOps and monitoring

Projects

Serverless Cloud Portfolio | *Python, AWS, Terraform, GitHub Actions* | GitHub Jun 2026 – Sep 2026

- Built a fully serverless portfolio on **AWS** using a private **S3** origin behind **CloudFront** with Origin Access Control, Route 53 DNS, and HTTPS only enforcement via ACM
- Developed a Python Lambda visitor counter with API Gateway and **DynamoDB**, using an **atomic update expression** to prevent race conditions under concurrent traffic
- Instrumented the backend with structured JSON logging and EMF custom metrics, making every request queryable in **CloudWatch** Logs Insights
- Delivered observability through a CloudWatch dashboard with SNS alerts for Lambda errors, DynamoDB throttling, and API Gateway 5xx responses
- Built a milestone alert that triggers a log entry, metric, SNS email and on-page toast at every 100th visitor, controlled by one Terraform variable
- Managed all core infrastructure in **Terraform** with least privilege IAM policies
- Automated deployments with GitHub Actions CI/CD, gating every release behind unit tests and authenticating via **OIDC federation**, so no AWS credentials are stored
- Measured results, each reproducible: Terraform apply **26 seconds** average over 3 runs, frontend push to live **16 seconds** and backend push to live **21.8 seconds** (averages of the last 5 runs), full rebuild from an empty state in about 15 to 20 minutes, 0 false alarms over 30 days, monthly cost USD 0.59

Load-Balanced Network Architecture | *AWS EC2, Nginx, Apache* | GitHub Jun 2026

- Configured **Nginx** as a reverse proxy to distribute traffic across Nginx and Apache backend servers on **AWS EC2**
- Applied IP-based filtering with **iptables** to reduce traffic abuse risk

Technical Skills

Languages: Python, SQL, Bash
Cloud: AWS, S3, CloudFront, Route 53, ACM, Lambda, API Gateway, DynamoDB, CloudWatch, SNS, IAM, EC2
DevOps, working knowledge: Terraform, GitHub Actions, CI/CD, Linux, Nginx, Git
DevOps, currently learning in a project: Docker, Kubernetes, GitOps, ArgoCD
Monitoring: CloudWatch, Prometheus and Grafana (learning)
Tools: Git, GitHub, VS Code

Certification

Google Cloud Arcade Program, Standard Milestone 2024
